Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(c) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 4/20/09 has been entered.

Allowable Subject Matter

2. Claims 21-24, 29-30 and 32, renumbered as 1-7 are allowed.

EXAMINER'S AMENDMENT

3. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Frederick Cooperrider on 5/25/09.

The application has been amended as follows:

21. (Currently Amended) A method of determining a most suitable cell during network acquisition for a cellular communications device, based on a characteristic of signals received from a plurality of cells, the signals from each cell being provided over a band of frequencies,

said method comprising: taking a series of measurements of said characteristics by said cellular communication device for each frequency of a first frequency band, so as to obtain an average measurement value of said characteristic for each frequency of said first frequency band, wherein the series of measurements on said first frequency band are equally spaced in time, with equal time intervals therebetween; and during the time intervals between measurements for said first frequency band, taking a series of measurements of said characteristic for each frequency of a second frequency band, wherein said first and second frequency bands operate in different operating modes, wherein said series of measurements on said first frequency band that is equally spaced in time is repeated a predetermined number of times to calculate said average measurement for each said frequency, wherein, before a completion of said predetermined number of times occurs and before said average measurement value is obtained, a second stage search operation processing is initiated for at least one detected strong signal.

23. (Currently Amended) A cellular communications device including means for determining a most suitable cell during network acquisition for a cellular communications device, based upon a characteristic of signals received from a plurality of cells, the signals from each cell being provided over a band of frequencies, said cellular communications device comprising:
a first unit for taking a series of measurements of said characteristics for each frequency of a first frequency band, so as to obtain an average measurement value of the characteristic for each frequency of the first frequency band, wherein the series of measurements on the first frequency band are equally spaced in time, with equal time intervals therebetween; and a second unit for taking a series of measurements of the characteristic for each frequency of a second frequency band during the time intervals between measurements for the first frequency band, wherein said

first and second frequency bands operate in different operating modes, wherein said first unit and said second unit take said series of measurements on said first frequency band and said second frequency band a predetermined number of times to calculate said average measurement for each said frequency in said first frequency band, wherein before a completion of said predetermined number of times occurs and before said average measurement value is obtained, a second stage search operation processing is initiated for at least one detected strong signal.

28. (cancelled)

29. (Currently Amended) A method of determining a most suitable cell and a most suitable mode for a cellular communication device capable of operating in at least two modes, each operating mode having a plurality of frequencies occupying a frequency band, said method comprising: selectively, for each time period of a predetermined number of successive time periods, said cellular communication device sequentially taking measurements of a characteristic for each frequency of each frequency band for each operating mode said cellular communication device is capable, each said time period being equal in time; calculating an average value of said characteristic for each frequency of each frequency band; and selecting said most suitable cell and said most suitable mode based upon said average values, wherein, before a completion of said predetermined number of times occurs and before said average measurement value is obtained, a second stage search operation processing is initiated for at least one detected strong signal .wherein before a completion of said predetermined number of times occurs and before

said average measurement value is obtained, a second stage search operation processing is initiated for at least one detected strong signal.

4. The following is an examiner's statement of reasons for allowance: The above noted claims have been indicated as allowable for reasons stated in Applicant remarks dated 2/25/09.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
